(54) Improvements in and relating to packaging.

(57) According to the invention, a composition for packaging use comprises -

(a) a polymer;

(b) an oxidisable polymer that is formally a condensation polymer of one or more compounds of the general formula (I),

wherein each of R_1 and R_3 , which may be the same or different, represents a non-aromatic group containing a saturated carbon atom adjacent to the respective $-\text{NH}_2$ group and wherein R_2 represents a substituted or unsubstituted arylene group,

with one or more compounds of the general formula (II),

wherein each of R_4 and R_6 , which may be the same or different, represents a direct bond or a non-aromatic group containing at least one carbon atom and wherein R_5 represents a substituted or unsubstituted arylene group,

the molar ratio of the compound of the general formula (I), or of such compounds taken together, to the compound of the general formula (II), or of such compounds taken together, being

1: x_{II} where $x_{II} \geq 0.05$; and

(c) a metal catalyst for the oxidation of the oxidisable polymer.

The composition may be used in a wall or a layer thereof, or as a headspace scavenger.

EP 0 380 319 A1

IMPROVEMENTS IN AND RELATING TO PACKAGING

The present invention relates to packaging, especially packaging of oxygen-sensitive materials, most especially of foods and beverages. One method of protecting such materials is by the use of oxygen scavenging either in the wall of a package or in the head-space.

In our copending UK patent application 88 15699.7 (and corresponding European patent application No. 88306175.6), we have described and claimed a wall for a package, which wall comprises, or includes a layer comprising, a composition comprising a polymer and having oxygen-scavenging properties, characterised in that the composition scavenges oxygen through the metal-catalysed oxidation of an oxidisable organic component thereof.

In a second aspect, the invention of the aforesaid UK patent application provides a composition for packaging use which comprises a polymer, an oxidisable organic component, and a metal catalyst for the oxidation of the oxidisable organic component.

The composition provided by the aforesaid invention has three major uses, namely as the material for a wall or a layer of a wall, as a masterbatch for blending with another polymer for such use, and as a head-space scavenger.

In a third aspect the aforesaid invention provides a package, whether rigid, semi-rigid, collapsible, lidded, or flexible or a combination of these, a wall of which is a wall as provided by the invention in its first aspect or comprises entirely, as a layer, or as a blend the composition provided by the invention in its second aspect.

The UK patent application corresponds to EPC patent application 88 306175.6 and PCT patent application GB/88 00532. The UK patent application has been published under number GB 2 207 439A. The entire disclosure of the aforesaid patent applications is incorporated herein by this reference.

However, it is convenient here to note the following points regarding the aforesaid invention:-

(1) It is possible in principle for the oxygen-scavenging properties of a wall or composition to be affected by illumination. However, scavenging which is highly dependent on such illumination is difficult to apply commercially. Therefore, all references to oxidation, oxidisability, and oxygen-scavenging properties, refer to the dark or else to conditions of irradiation not appreciably contributing to oxygen-scavenging.

(2) The oxidisable organic component may be an oxidisable polymer. The use of an oxidisable polymer as the oxidisable organic component has the advantage, broadly speaking, over the use of an oxidisable non-polymeric component that it is less likely to affect adversely the properties of a non-oxidisable polymer with which it is blended. It is possible for an oxidisable polymer to be used as the sole polymer in the composition, serving a dual function as polymer and oxidisable organic component.

(3) It is of course possible for two or more polymers, two or more oxidisable organic components, or two or more catalysts to be used. It is possible also for a metal catalyst to be used in combination with a non-metal catalyst. For instance, with some oxidisable organic components an organic peroxide may be used in combination with the metal catalyst.

(4) By "wall for a package" is meant (except where the context indicates otherwise) not only a wall when incorporated into a package structure but also packaging materials capable of forming walls, such as package bases, packaging sheet, and so on.

(5) The word "catalyst" is used in a general way readily understood by the man skilled in the art, not necessarily to imply that it is not consumed at all in the oxidation. It is indeed possible that the catalyst may be converted cyclically from one state to another and back again as successive quantities of oxidisable component are consumed by successive quantities of oxygen. However, it may be that some is lost in side reactions, possibly contributing directly to oxygen-scavenging in small measure, or indeed that the "catalyst" is more properly described as an initiator (e.g. generating free radicals which through branching chain reactions lead to the scavenging of oxygen out of proportion to the quantity of "catalyst").

(6) The wall may be a rigid one, a flexible sheet, or a clinging film. It may be homogenous or a laminate or coated with other polymers. If it is laminated or coated, then the scavenging property may reside in a layer of the wall the permeance of which, for oxygen, would be relatively high in the absence of scavenging and which alone would not perform very satisfactorily but which performs satisfactorily in combination with one or more other layers which have a relatively low permeance but negligible or insufficient oxygen-scavenging properties. A single such layer could be used on the outside of the package since this is the side from which oxygen primarily comes when the package is filled and sealed. However, such a layer to either side of the scavenging layer would reduce consumption of scavenging capacity prior to filling and sealing.

(7) Polyesters and polyolefins are especially suitable as non-oxidisable polymeric components,

especially ethylene terephthalate or ethylene naphthalate polyesters.

In the aforesaid patent applications, it is stated that particularly interesting oxidisable organic components are polyamides, especially those containing groups of the formula

- arylene-CH₂-NH-CO-, conveniently in the form of

- 5 -NH-CH₂-arylene-CH₂-NH-CO-alkylene-CO-units. Metal catalysis is advantageously provided by compounds of cobalt, copper and rhodium.

It is appropriate to note here that many polyamides are known per se, e.g. from UK patent specification 1428197, European patent application 65278A2, and US patent 4122802.

- 10 We have now discovered that it is advantageous in the exercising of our aforesaid invention in all its aspects to use an oxidisable polymer that is formally a condensation polymer of one or more compounds of the general formula (I).

wherein each of R₁ and R₃, which may be the same or different, represents a non-aromatic group containing a saturated carbon atom adjacent to the respective -NH₂ group and wherein R₂ represents a

- 15 substituted or unsubstituted arylene group, with one or more compounds of the general formula (II),

wherein each of R₄ and R₆, which may be the same or different, represents a direct bond or a non-aromatic group containing at least one carbon atom and wherein R₅ represents a substituted or unsubstituted arylene

- 20 group, the molar ratio of the compound of the general formula (I), or of such compounds taken together, to the compound of the general formula (II), or of such compounds taken together, being 1: x_{II} where x_{II} ≥ 0.05.

- 25 An advantage of the use of an oxidisable polymer in accordance with the present invention over the use of a polyamide derived from an alkylenediamine as described in our copending applications is that the refractive index of a polymer containing the arylene group R₅ will in general be more similar in refractive index to non-oxidisable polyesters containing arylene groups in the acid component thereof, such as phthalate and naphthalate polyesters. Thus, blends of the polyesters with the oxidisable polymers used in accordance with the present invention will in general have better clarity.

- 30 The oxidisable polymer used in accordance with the present invention may include, formally, as components among others the following: compounds of the general formula (III),

wherein R₇ is a group containing a saturated carbon atom adjacent to each -OH group; and

- 35 compounds of the general formula (IV),

wherein R₈ represents a non-aromatic group containing at least one carbon atom.

Among preferred groups R₁ to R₈, there may be mentioned the following:-

For R₁ and R₃, methylene groups.

- 40 For R₂ and R₅, phenylene groups, especially *m*-phenylene groups.

For R₇, alkylene groups of from 1 to 10 carbon atoms, especially the ethylene group.

For R₈, alkylene groups of from 1 to 10 carbon atoms, especially the *n*-butylene group.

- 45 Except where the context necessarily indicates otherwise, all of the convenient, advantageous, and preferred features referred to in the aforesaid copending applications are likewise convenient, advantageous, or preferred in relation to the present invention.

The present invention will now be further described, by way of illustration only, by means of the following Experiments.

50 EXPERIMENTS

POLYMER PREPARATION

55

Polymers were synthesised as follows:

Polymer (i): *m*-xylylenediamine, isophthalic acid, and adipic acid in a molar ratio of 1 : 0.1 : 0.9 were used as monomers.

(Note: m-xylylenediamine is $\text{H}_2\text{NCH}_2\text{-m-C}_6\text{H}_4\text{-CH}_2\text{NH}_2$, isophthalic acid is $\text{HO}_2\text{C-m-C}_6\text{H}_4\text{-CO}_2\text{H}$; and adipic acid is $\text{HO}_2\text{C(CH}_2)_4\text{CO}_2\text{H}$.)

The copolymerisation was effected without solvent or catalyst under gentle reflux for two hours. The product was liquid when hot, and solidified to a mass on cooling. The product was broken up and stirred in acetone, filtered, and air-dried under suction at room temperature.

Polymer (ii): this was a repeat preparation of polymer (i).

Polymer (iii): this polymer was prepared like polymer (i) except that the molar ratios of m-xylylenediamine, isophthalic acid and adipic acid were 1 : 0.2 : 0.8.

Polymer (iv): this polymer was prepared like polymer (i) except that the molar ratios of m-xylylenediamine, isophthalic acid, and adipic acid were 1 : 0.4 : 0.6.

Polymer (v): this was a repeat preparation of polymer (iv).

Polymer (vi): this polymer was prepared like polymer (i) except that the molar ratios of m-xylylenediamine, isophthalic acid, and adipic acid were 1 : 0.5 : 0.5.

STANDARD SAMPLES FOR TEST

Each of these polymers (i) to (vi) were made up into one or more standard samples according to the A,B and/or C procedures below. The samples are designated in a self-evident manner: a standard sample made up from polymer (i) by procedure A is called sample (i)A; one made up from polymer (iii) by procedure C is called sample (iii)C; and so on.

Procedure A 5g of the respective polymer were weighed out.

Procedure B 5g of the respective polymer were suspended in approximately 20 cm³ acetone, and 0.125mg of copper were added in the form of a solution of copper acetate in 1 cm³ methanol. The mixture was stirred and then dried on a warm hotplate.

Procedure C 5g of the respective polymer were suspended in approximately 20 cm³ acetone, and 1 mg of cobalt was added in the form of a solution of cobalt acetate in methanol. The mixture was stirred and then dried on a warm hotplate.

TESTING PROCEDURE

Each of the five samples was enclosed with air in a glass bottle of capacity 5 cm³ with a rubber septum and aluminium closure. The headspace gas was sampled as a function of time and analysed for oxygen.

The results are summarised in the Table. The results show the marked oxygen-scavenging effect of polymers (i) to (vi), being oxidisable polymers to be used in accordance with the invention, in the presence of metal catalyst. The tests on the A samples are uncatalysed "controls".

Claims

1. A wall for a package, which wall comprises, or includes a layer comprising, a composition comprising a polymer and having oxygen scavenging properties, characterised in that the composition scavenges oxygen through the metal-catalysed oxidation of an oxidisable polymer that is formally a condensation polymer of one or more compounds of the general formula (I),

- wherein each of R₁ and R₃, which may be the same or different, represents a non-aromatic group containing a saturated carbon atom adjacent to the respective -NH₂ group and wherein R₂ represents a substituted or unsubstituted arylene group, with one or more compounds of the general formula (II),

wherein each of R_4 and R_6 , which may be the same or different, represents a direct bond or a non-aromatic group containing at least one carbon atom and wherein R_5 represents a substituted or unsubstituted arylene group,

- 5 the molar ratio of the compound of the general formula (I), or of such compounds taken together, to the compound of the general formula (II), or of such compounds taken together, being
1: x_{II} where $x_{\text{II}} \geq 0.05$.

2. A wall according to claim 1, wherein the oxidisable polymer is formally a condensation polymer of one or more compounds the general formula (I) as aforesaid and one or more compounds of the general
10 formula (II) as aforesaid, together with one or more compounds of the general formula (IV),
 $\text{HO}_2\text{C}-\text{R}_8-\text{CO}_2\text{H} \quad (\text{IV})$

wherein R_8 represents a non-aromatic group containing at least one carbon atom, the molar ratios of the compounds of the general formulas (I), (II) and (IV),

- or respectively of such compounds taken together, being 1 : x_{II} : x_{IV} where $(x_{\text{II}} + x_{\text{IV}})$ is essentially equal to
15 1.0 and x_{II} is in the range from 0.05 to 1.0.

3. A wall according to claim 1 or claim 2, wherein the polymer is distinct from the oxidisable polymer and is formally a condensation polymer of one or more aromatic dicarboxylic or polycarboxylic acids with one or more compounds containing at least two alcoholic hydroxy groups per molecule.

4. A composition for packaging use, which comprises-

- 20 (a) a polymer;

(b) an oxidisable polymer that is formally a condensation polymer of one or more compounds of the general formula (I),

- wherein each of R_1 and R_3 , which may be the same or different, represents a non-aromatic group
25 containing a saturated carbon atom adjacent to the respective $-\text{NH}_2$ group and wherein R_2 represents a substituted or unsubstituted arylene group,

with one or more compounds of the general formula (II),

- wherein each of R_4 and R_6 , which may be the same or different, represents a direct bond or a non-aromatic
30 group containing at least one carbon atom and wherein R_5 represents a substituted or unsubstituted arylene group,

the molar ratio of the compound of the general formula (I), or of such compounds taken together, to the compound of the general formula (II), or of such compounds taken together, being

1: x_{II} where $x_{\text{II}} \geq 0.05$; and

- 35 (c) a metal catalyst for the oxidation of the oxidisable polymer.

5. A composition according to claim 4, wherein the oxidisable polymer has the features specified in claim 2.

6. A composition according to claim 4, wherein the polymer has the features specified in claim 3.

7. A package comprising a wall according to any one of claims 1 to 3, or a wall which comprises
40 entirely, as a layer, or as a blend a composition according to any one of claims 4 to 6.
